

Dear Paco,

Regarding the state of the trees located at 7 Almizcle, I wanted to comment you some aspects:

- We carried out multitude of treatments to try and enhance the look of the trees which surround this building (extra fertilization, edgings around the trees, manual irrigation with hose, etc.).
- As I commented to you on other occasions, I noticed the soil in Phase 1 is very low quality (much of it is filling soil), especially that next to your building; it varies a lot with regards to the soil in other phases.
- The plantation methods used at that time (which you commented you were witness of), as well as the maintenance carried out by the previous company (most of the trees are damaged at their base), caused these trees could not develop properly.
- In order to find a solution to this problem, we looked for species which developed properly in you phase (schinus molle, tipuanas, etc.) and, in order to correct this situation, we provided you with some quotes so that the president of your sub-community could approve it, but I did not have any response.
- I understand your concern regarding the trees, so I will be happy to meet with you next time you are in Riquelme.

Regards,

Alfonso
